Chemistry Matter Change Chapter 9 Worksheet Answers Unlocking the Secrets of Change Chapter 9 Chemistry Matter Change Worksheet Answers Chemistry is the study of matter and its properties as well as how matter changes One of the most fascinating aspects of chemistry is the study of chemical reactions where substances transform into new substances with different properties Understanding how matter changes is crucial for comprehending the world around us from the rusting of a car to the burning of a candle Chapter 9 of your chemistry textbook likely delves into this topic providing insights into the different types of chemical reactions and the factors that influence them This article aims to provide comprehensive answers to the worksheet questions associated with Chapter 9 Chemistry Matter Change Each question will be analyzed explained and supported with relevant examples and scientific concepts Worksheet Answers 1 What is a chemical reaction A chemical reaction is a process that involves the rearrangement of atoms and molecules to form new substances It is characterized by the breaking and forming of chemical bonds leading to changes in the composition and properties of the reactants Example The reaction between sodium Na and chlorine Cl to form sodium chloride NaCl commonly known as table salt is a chemical reaction The sodium and chlorine atoms combine to form a new substance sodium chloride with entirely different properties 2 What are the signs that a chemical reaction has occurred While not all reactions display all these signs observing one or more of them can indicate a chemical reaction has taken place Change in color The color of the substances involved can change during a reaction For instance the burning of wood produces ash a change in color from brown to gray Formation of a precipitate A precipitate is an insoluble solid that forms during a reaction For example when silver nitrate AgNO<sub>3</sub> reacts with sodium chloride NaCl a white precipitate of silver chloride AgCl forms Production of gas The release of gas bubbles during a reaction is a sign of chemical change For example when baking soda NaHCO<sub>3</sub> reacts with vinegar CH<sub>3</sub>COOH carbon dioxide gas CO<sub>2</sub> is produced causing the mixture to fizz Change in temperature Reactions can either release heat exothermic or absorb heat endothermic resulting in a change in temperature For example the burning of fuel releases heat while the dissolving of ammonium chloride in water absorbs heat Emission of light Some reactions release energy in the form of light causing a visible glow For example the burning of magnesium ribbon emits a bright white light 3 What are reactants and products Reactants The substances that are present at the beginning of a chemical reaction and undergo change are called reactants They are written on the left side of a chemical equation Products The new substances formed during a chemical reaction are called products They are written on the right side of a chemical equation Example In the reaction of sodium and chlorine sodium and chlorine are the reactants while sodium chloride is the product Na + Cl<sub>2</sub> → NaCl 4 What is a chemical equation A chemical equation is a symbolic representation of a chemical reaction using chemical formulas to represent reactants and products It also includes coefficients to balance the number of atoms of each element on both sides of the equation Example The balanced chemical equation for the combustion of methane CH<sub>4</sub> is CH<sub>4</sub> + 2O<sub>2</sub> → CO<sub>2</sub> + 2H<sub>2</sub>O 5 What are the different types of chemical reactions Chemical reactions are categorized based on the types of changes they involve Here are some common types Synthesis reactions Two or more reactants combine to form a single product Example 2Na + Cl<sub>2</sub> → 2NaCl Decomposition reactions A single reactant breaks down into two or more products Example 2H<sub>2</sub>O → 2H<sub>2</sub> + O<sub>2</sub> Single displacement reactions An element reacts with a compound displacing one of the 3 elements in the compound Example Zn + CuSO<sub>4</sub> → ZnSO<sub>4</sub> + Cu Double displacement reactions Two compounds react exchanging ions to form two new compounds Example AgNO<sub>3</sub> + NaCl → AgCl + NaNO<sub>3</sub> Combustion reactions A substance reacts rapidly with oxygen releasing heat and light Example CH<sub>4</sub> + 2O<sub>2</sub> → CO<sub>2</sub> + 2H<sub>2</sub>O 6 What are the factors that affect the rate of a chemical reaction The rate of a chemical reaction is determined by the speed at which reactants are converted into products The following factors can influence the reaction rate Temperature Increasing temperature generally speeds up a reaction because it provides more energy to the molecules increasing the frequency of collisions and successful reactions Concentration Increasing the concentration of reactants leads to more frequent collisions resulting in a faster

reaction rate Surface area Increasing the surface area of reactants allows for more contact points for collisions accelerating the reaction Catalyst Catalysts are substances that speed up a reaction without being consumed in the process They provide an alternative reaction pathway with a lower activation energy making it easier for reactions to occur Nature of reactants The type of chemical bonds present in the reactants influences the ease with which they can break and form new bonds impacting the reaction rate 7 What is the Law of Conservation of Mass The Law of Conservation of Mass states that in a closed system the total mass of the reactants before a chemical reaction must equal the total mass of the products after the reaction This means that matter cannot be created or destroyed in a chemical reaction only rearranged Example When 1 gram of hydrogen reacts with 8 grams of oxygen it forms 9 grams of water The total mass before the reaction 1 8 9 grams is equal to the total mass after the reaction 9 grams demonstrating the conservation of mass 8 What is a balanced chemical equation A balanced chemical equation represents a chemical reaction where the number of atoms of each element on both sides of the equation is equal This ensures that the Law of Conservation of Mass is upheld Example The balanced chemical equation for the synthesis of ammonia  $\text{NH}_3$  is  $\text{N}_2 + 3\text{H}_2 \rightarrow 2\text{NH}_3$  2 nitrogen atoms on the left side 2 nitrogen atoms on the right side 6 hydrogen atoms on the left side 6 hydrogen atoms on the right side 9 How do you balance a chemical equation To balance a chemical equation you need to adjust the coefficients numbers in front of the chemical formulas until the number of atoms of each element is the same on both sides This process often involves trial and error Steps for Balancing Chemical Equations 1 Write the unbalanced chemical equation with the correct chemical formulas for reactants and products 2 Count the number of atoms of each element on both sides of the equation 3 Adjust the coefficients in front of the chemical formulas to balance the number of atoms of each element 4 Doublecheck that the equation is balanced by counting the atoms again 10 What is a chemical reaction rate The chemical reaction rate refers to the speed at which a reaction occurs It is typically measured as the change in concentration of reactants or products per unit time A higher reaction rate indicates that the reaction is proceeding faster while a lower reaction rate indicates a slower reaction 11 What are the units for chemical reaction rate The units for chemical reaction rate depend on the specific reaction and the method of measurement However common units include Molarity per second Ms Measures the change in concentration of a reactant or product in moles per liter per second Molecules per second mols Measures the number of molecules reacting or forming per second Percentage change per unit time Represents the change in concentration as a percentage over a certain period Conclusion 5 Understanding chemical reactions and the factors that influence them is fundamental to comprehending the world around us By mastering the concepts presented in Chapter 9 Chemistry Matter Change you will be equipped to analyze and predict how matter transforms unraveling the secrets of change in the fascinating field of chemistry Remember to refer to the explanations and examples provided in this article to enhance your understanding and confidently answer your worksheet questions
